MAY 2016 E-NEWSLETTER

Wonder Makers Bounces to New Heights in Contaminant Control Industry

People who have worked with the Wonder Makers' team realize that we are very serious about our efforts to assist individuals with contaminants in buildings. Problems such as mold, asbestos, lead, infectious materials, drug residues, and the like require a knowledgeable and professional approach to protect the health of occupants.

However, every once in a while you have to have fun with your work. Early summer is a good time to take a slightly more lighthearted approach to some potentially serious situations. Wonder Makers was recently contacted by a local television station to offer a professional opinion regarding some of the health concerns that have surfaced from children playing in bounce houses. There are a number of well-documented incidents of kids picking up some fairly nasty skin infections from playing inside inflatable amusements. As might be expected, jumping vigorously and tumbling around in such play houses can lead to the occasional abrasion. Reports of these types of skinned knees, hands, or cheeks developing into more serious problems such as MRSA (methicillin-resistant Staphylococcus aureus) infections have been shared from a number of southern states. So the question to be answered in Kalamazoo was, "How dirty are these bounce houses?"

For those inquiring minds that want to know the answer to this fascinating question, we would encourage you to jump on the link below and see the news report that aired on May 24. You can witness our fearless leader sacrificing his personal safety to enter a bounce house with a three-year-old.

Related Training Course

Remediation for Sensitized Individuals - There is a critical need for environmental contractors who are specifically trained to help sensitized people find a safe haven in their homes. This one-day technical seminar is designed for mold remediation contractors, cleaning companies, inspectors, and others who are serious about assisting sensitized people. It offers a comprehensive approach to these challenging situations by addressing every aspect of a mold remediation project, including source removal, content cleaning, decontamination of HVAC systems, and elimination of microbial reservoirs from the entire structure.
